Let $X = \text{spec } A$ be a normal affine variety endowed with an effective action of a torus T of dimension n . To introduce a G_a -action on X is equivalent to fix a locally nilpotent derivation D on the \mathbb{Z}_n -graded algebra A . In this talk we show some classification result of pairs (A, D) in the case where D is homogeneous and with special emphasis in the case where the general orbits of the G_a -action are contained in the orbit closures of the T -action. In particular, we give the birational characterization of normal affine varieties with trivial Makar-Limanov invariant.
